Designing a Data Model with Power BI Desktop

Agenda

- Creating Table Relationships
- Creating Calculated Columns and Measure
- Creating Tables using DAX Expressions
- Configuring Fields for Geographic Mapping
- Creating Dimensional Hierarchies
- Using the DAX Calculate Function
- Calendar Tables and Time Intelligence

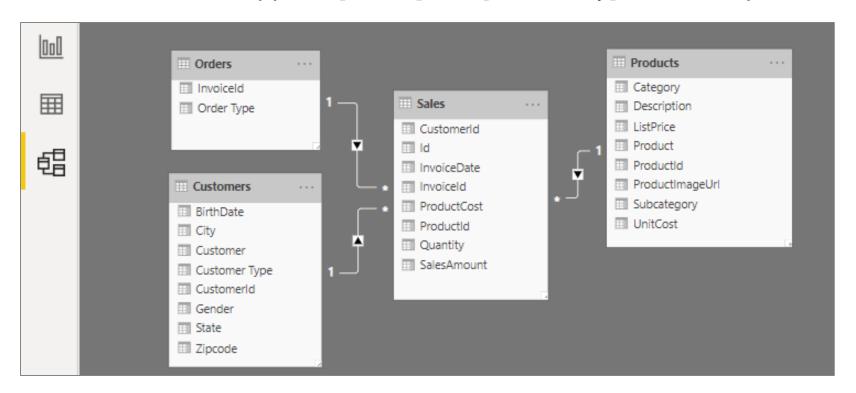

Data Modeling with Power BI Desktop

- Steps to create a data model with Power Pivot
 - Create relationships between tables
 - Modify native columns (e.g. set formatting and data category)
 - Create calculated columns
 - Create measures
 - Create dimensional hierarchies
 - Add Calendar table(s)

Table Relationships

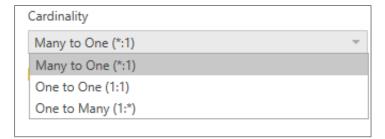

- Tables in data model associated with relationships
 - Relationships based on single columns
 - Tabular model supports [1-to-1] and [1-to-many] relationships

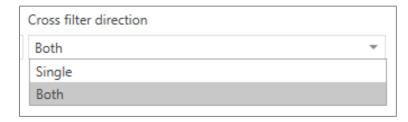

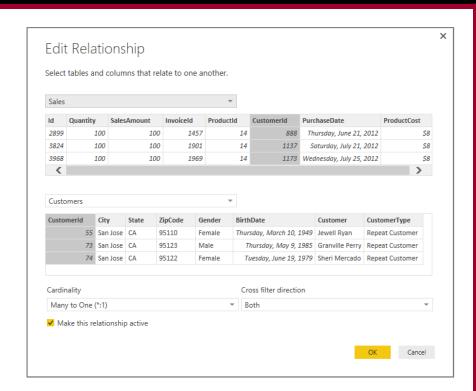

Relationship Properties

Cardinality

Cross filter direction

Agenda

- Creating Table Relationships
- Creating Calculated Columns and Measure
- Creating Tables using DAX Expressions
- Configuring Fields for Geographic Mapping
- Creating Dimensional Hierarchies
- Using the DAX Calculate Function
- Calendar Tables and Time Intelligence

Working with DAX

- DAX is the language used to create data models
 - DAX stands for "Data Analysis Expression Language"
- DAX expressions are similar to Excel formulas
 - They always start with an equal sign (=)
 - DAX provides many built-in functions similar to Excel
- DAX Expressions are unlike Excel formulas...
 - DAX expressions cannot reference cells (e.g. A1 or C4)
 - Instead DAX expressions reference columns and tables

```
=SUM('Sales'[SalesAmount])
```

Writing DAX Expressions

Some DAX expressions are simple

```
Sales Revenue = Sum(Sales[SalesAmount])
```

Some DAX expressions are far more complex

```
Sales Growth PM = IF(
  ( ISFILTERED(Calendar[Month]) && ISFILTERED(Calendar[Date]) = FALSE() ),
  DIVIDE(
   SUM(Sales[SalesAmount]) -
   CALCULATE(
      SUM(Sales[SalesAmount]),
      PREVIOUSMONTH(Calendar[Date])
    ),
   CALCULATE(
      SUM(Sales[SalesAmount]),
      PREVIOUSMONTH(Calendar[Date])
  BLANK()
```

Creating Variables in DAX Expressions

- Variables can be added at start of expression
 - Use VAR keyword once for each variable
 - Use RETURN keyword to return expression value

```
Budget Key =
  VAR BudgetYear = YEAR([Date])
  VAR BudgetMonth = "Q" & FORMAT([Date],"q")
RETURN
  BudgetYear & "-" & BudgetMonth & "-" & [Category]
```

Calculated Columns vs Measures

- Calculated Columns (aka Columns)
 - Evaluated based on context of a single row
 - Evaluated when data is loaded into memory

```
Column1 = <DAX expression>
```

- Measures
 - Evaluated at query time based on current filter context
 - Commonly used for aggregations (e.g. SUM, AVG, etc.)
 - Used more frequently than calculated columns

```
Measure1 = <DAX expression>
```

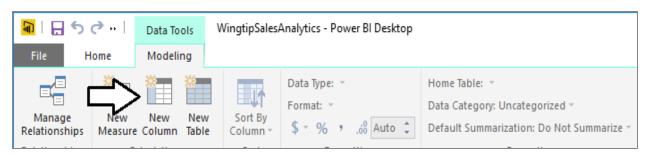

When to Create Calculated Columns

- Measures often better choice than calculate columns
 - Don't create calculated column when you need a measure
 - Prefer to create calculated columns only in specific scenarios
- When should you create calculated columns?
 - To create headers for row labels or column labels
 - To place calculated results in a slicer for filtering
 - Define an expression strictly bound to current row
 - Categories text or numbers (e.g. customer age groups)

Creating Calculated Columns

- Edited in formula bar of Power Pivot data view
 - Start with name and then equals (=) sign
 - Enter a valid DAX expression
 - Clicking on column adds it into expression

000	× 🗸 🛚	Age = Floo	or((TODAY()	-Customers[l	BirthDate])/	365, 1)				
	CustomerId 🔻	City -	State -	Zipcode 🔻	Gender ▼	BirthDate ▼	Customer -	Customer Type 🔻	Age	¥
田	760	San Jose	CA	95133	Female	3/16/1968	Lucile Blake	One-time Customer		51
_	881	San Jose	CA	95133	Female	7/19/1942	Rochelle Owen	One-time Customer		77
铝	940	San Jose	CA	95133	Female	3/7/1943	Corinne Finch	One-time Customer		76
	1119	San Jose	CA	95133	Female	9/3/1990	Twila Massey	One-time Customer		29

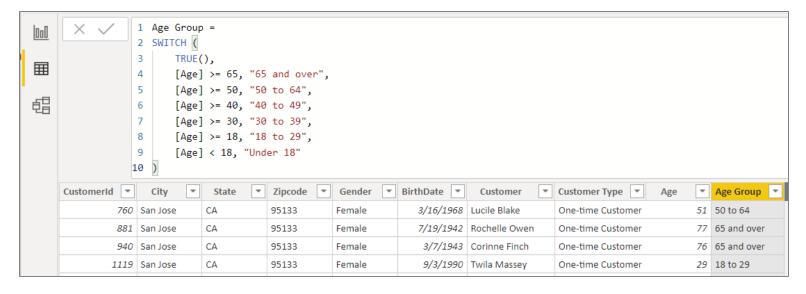

Calculated Column for Customer Age Group

1. Calculate customer age from birthdate

2. Calculate age groups using calculated column

Calculated Column used in a Slicer

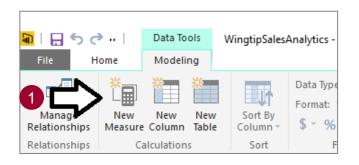

Calculated column can populate slicer values

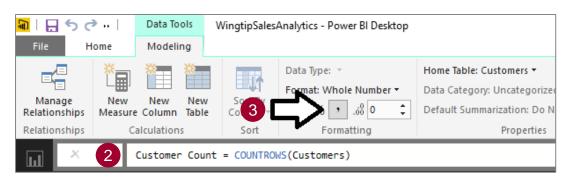

Creating Measures

- Measures have advantage over calculated columns
 - They are evaluated based on the current evaluation context
- Creating a measure with Power BI Desktop
 - Click New Measure button
 - 2. Give measure a name and write DAX expressions
 - 3. Configure formatting

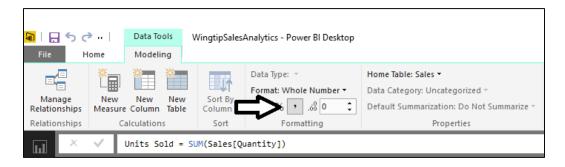

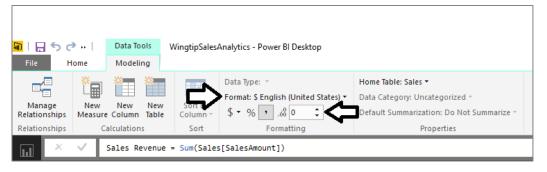

Formatting Measures

Format as whole number

Format as currency

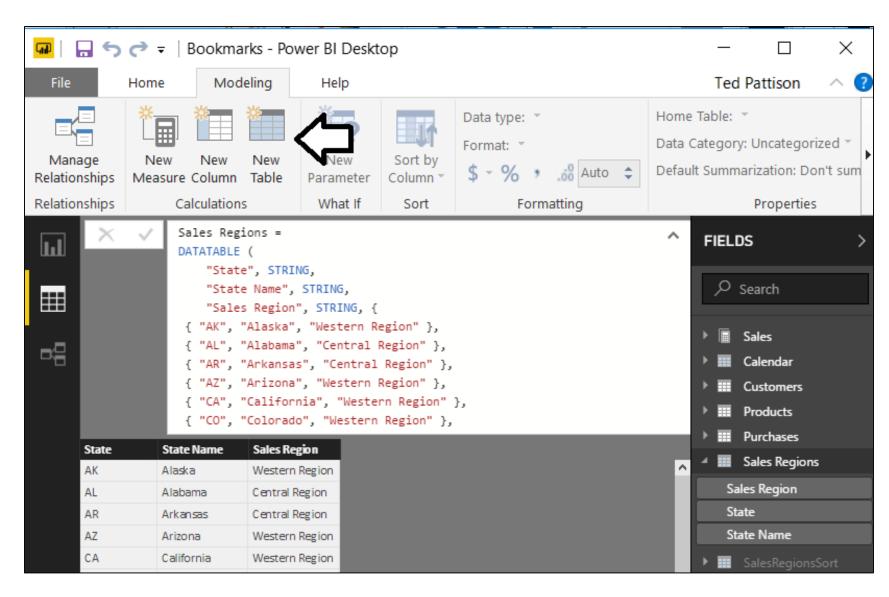

Agenda

- Creating Table Relationships
- ✓ Creating Calculated Columns and Measure
- Creating Tables using DAX Expressions
- Configuring Fields for Geographic Mapping
- Creating Dimensional Hierarchies
- Using the DAX Calculate Function
- Calendar Tables and Time Intelligence

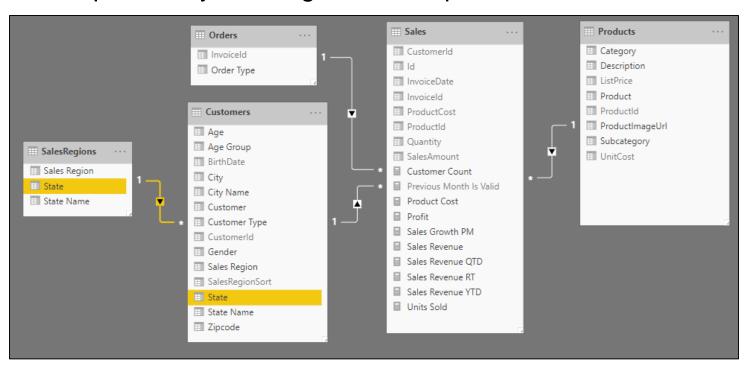

Creating Tables Dynamically using DAX

Integrating the Lookup Table into the Data Model

- Lookup table must be integrated into data model
 - Accomplished by creating relationship to one or more tables

The RELATED Function

- RELATED function performs cross-table lookup
 - Effectively replaces older VLOOKUP function
 - Used in many-side table to look up value from one-side
 - Used to pull data from lookup table into primary table

× ✓ 1	. Sales Regi	ion = RELATE	D(SalesRegio	ons[Sales Re	gion])		•		•	
CustomerId 💌	City ▼	State •	Zipcode 🔻	Gender ▼	BirthDate 🔻	Customer v	Customer Type ▼ Age	-	Age Group	Sales Region 💌
760	San Jose	CA	95133	Female	3/16/1968	Lucile Blake	One-time Customer	51	50 to 64	Western Region
881	San Jose	CA	95133	Female	7/19/1942	Rochelle Owen	One-time Customer	77	65 and over	Western Region
040	San Jaca	CA	05122	Famala	2/7/1042	Carinna Finah	One time Customer	75	SE and over	Mostorn Rogion

×	1 9	State Name =	RELATED(Sal	esRegions[State	Name])				
-	Zipcode 🔻	Gender ▼	BirthDate ▼	Customer -	Customer Type ▼ Age	•	Age Group ▼	Sales Region 💌	State Name
	95133	Female	3/16/1968	Lucile Blake	One-time Customer	51	50 to 64	Western Region	California
	95133	Female	7/19/1942	Rochelle Owen	One-time Customer	77	65 and over	Western Region	California
	95133	Female	3/7/1943	Corinne Finch	One-time Customer	76	65 and over	Western Region	California

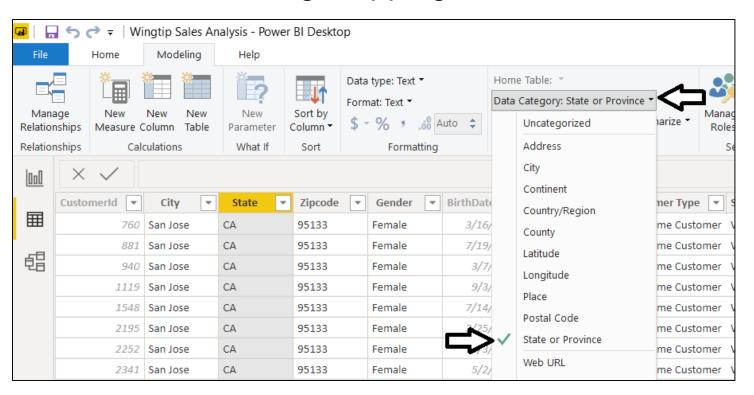

Agenda

- ✓ Creating Table Relationships
- ✓ Creating Calculated Columns and Measure
- Creating Tables using DAX Expressions
- Configuring Fields for Geographic Mapping
- Creating Dimensional Hierarchies
- Using the DAX Calculate Function
- Calendar Tables and Time Intelligence

Geographic Field Metadata

- Fields in data model have metadata properties
 - Metadata used by visuals and reporting tools
 - Used as hints to Bing Mapping service

Eliminate Geographic Ambiguity

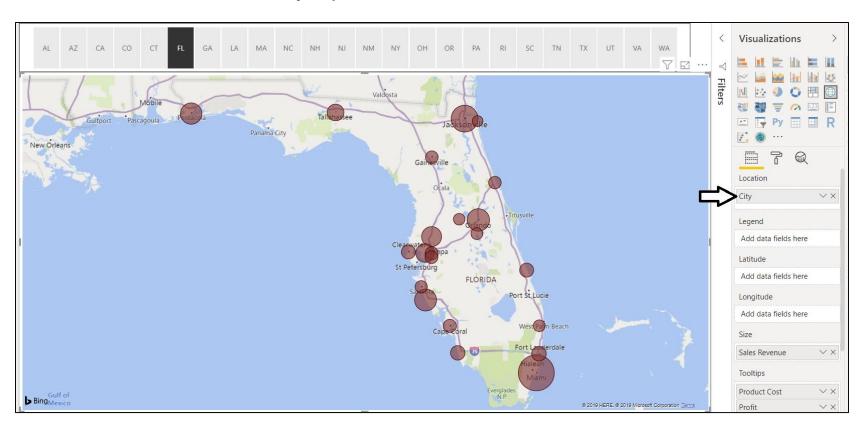

- City name alone is ambiguous
 - "Athens" defaults to Greece not Georgia
 - Concatenate city name with state to disambiguate

Using Map Visual with a Geographic Field

- Map Visual shows distribution over geographic area
 - Visual automatically updates when filtered

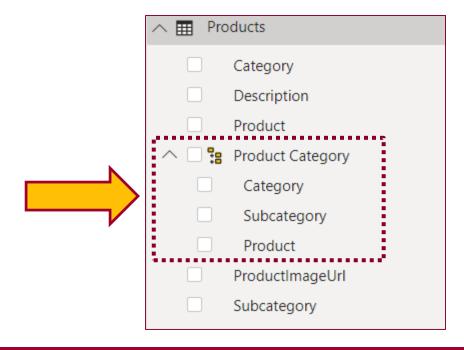

Agenda

- Creating Table Relationships
- ✓ Creating Calculated Columns and Measure
- Creating Tables using DAX Expressions
- Configuring Fields for Geographic Mapping
- Creating Dimensional Hierarchies
- Using the DAX Calculate Function
- Calendar Tables and Time Intelligence

Dimensional Hierarchies

- Hierarchy created from two or more columns
 - All columns in hierarchy must be from the same table
 - Defines parent-child relationship between columns
 - Provides path to navigate through data
 - Provides path to drill down into greater level of detail

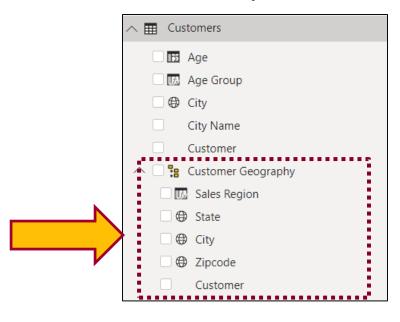

Pulling Columns for Hierarchy into Single Table

- Sometimes hierarchy columns are spread across tables
 - Use RELATED function from DAX to pull columns into single table

Then create hierarchy in the table with all the columns

Agenda

- ✓ Creating Table Relationships
- ✓ Creating Calculated Columns and Measure
- Creating Tables using DAX Expressions
- Configuring Fields for Geographic Mapping
- Creating Dimensional Hierarchies
- Using the DAX Calculate Function
- Calendar Tables and Time Intelligence

A Tale of Two Evaluation Contexts

Row Context

- Context includes all columns in iteration of current row
- Used to evaluate DAX expression in calculated column
- Only available in measures with iterator function (e.g. SUMX)

Filter Context

- Context includes filter(s) defining current set of rows
- Used by default to evaluate DAX expressions in measures
- Can be fully ignored or partially ignored using DAX code
- Not used to evaluate DAX in calculated columns

Understanding Row Context

Row context used to evaluate calculated columns

>	City = [City Name]	& ", " & [State]			
	Age Group	Sales Region	State Name	SalesRegionSort	City
48	Ages 40 TO 49	Western Region	California	1	San Jose, CA
74	Ages 65 and over	Western Region	California	1	San Jose, CA
73	Ages 65 and over	Western Region	California	1	San Jose, CA
25	Ages 18 TO 23	Western Region	California	1	San Jose, CA
61	Ages 50 TO 65	Western Region	California	1	San Jose, CA
65	Ages 65 and over	Western Region	California	1	San Jose, CA

× ✓	Ag	ge = Floor((TODA	AY()-Custome	rs[BirthDate])	/365, 1)	
Customer		Customer Type	Age	Age Group	Sales Region	State Name
Lucile Blake		One-time Customer	48	Ages 40 TO 49	Western Region	California
Rochelle Owen		One-time Customer	74	Ages 65 and over	Western Region	California
Corinne Finch		One-time Customer	73	Ages 65 and over	Western Region	California

Understanding Iterators Like SUMX

- Standard aggregation functions (e.g. SUM) have no row context
 - You can use SUM to sum values of a single column
 - You cannot use SUM to sum results of an expressions

```
Gross Margin = SUM( Sales[SalesAmount]-Sales[ProductCost] )

The SUM function only accepts a column reference as an argument.
```

Iterator functions (e.g. SUMX) iterate through rows in target table

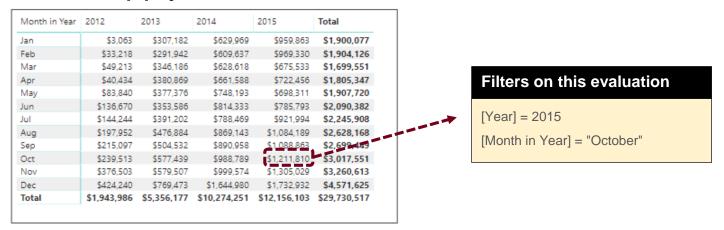

```
X ✓ Gross Margin = SUMX(Sales, Sales[SalesAmount]-Sales[ProductCost] )
```

- First argument accepts expressions that evaluates to table of rows
- Second argument accepts expression that is evaluated for each row

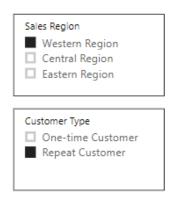

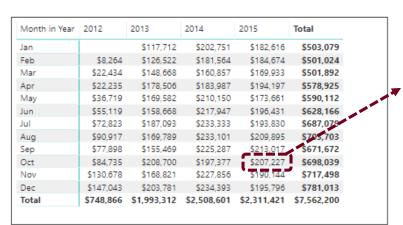

Understanding Filter Context

Visuals apply various filters in different evaluation contexts

Filter context also affected by slicers and other filters

Using the CALCULATE Function

- CALCULATE function provides greatest amount of control
 - First argument defines expression to evaluate
 - Second argument defines table on which to evaluate expression
 - You can evaluate expressions with or without current filter context

```
Pct of All Products =
DIVIDE(
    SUM( Sales[SalesAmount] ),
    CALCULATE(
        Sum (Sales[SalesAmount] ),
        ALL(Products[Category], Products[Subcategory], Products[Product])
    )
)
```

```
Pct of Product Category =
DIVIDE(
    SUM( Sales[SalesAmount] ),
    CALCULATE(
        Sum (Sales[SalesAmount] ),
        ALL( Products[Subcategory], Products[Product] )
    )
)
```

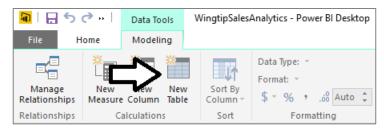

Agenda

- ✓ Creating Table Relationships
- ✓ Creating Calculated Columns and Measure
- Creating Tables using DAX Expressions
- Configuring Fields for Geographic Mapping
- Creating Dimensional Hierarchies
- Using the DAX Calculate Function
- Calendar Tables and Time Intelligence

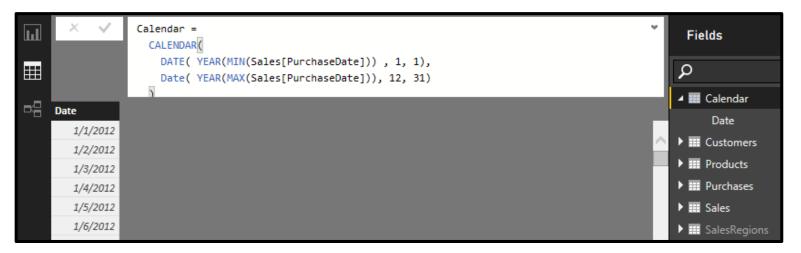

Creating Calendar Table as Calculated Table

Use New Table command in ribbon

Create calendar table using DAX CALENDAR function

Adding Columns to Calendar Table

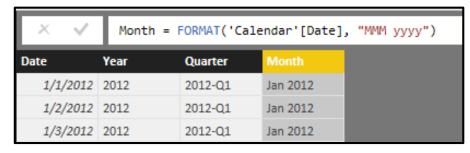

Creating the Year column

Creating the Quarter column

Creating the Month column

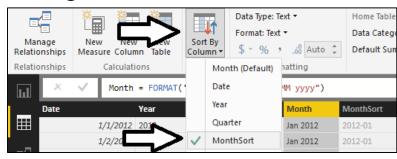

Configuring Sort Columns

- Month column will not sort in desired fashion by default
 - For example, April will sort before January, February and March
- Creating a sort column for the Month column
 - MonthSort sorts alphabetically & chronologically at same time

× •	MonthSor	t = FORMAT('	Calendar'[D	ate], "yyyy-MM	1")
Date	Year	Quarter	Month	MonthSort	
1/1/2012	2012	2012-Q1	Jan 2012	2012-01	
1/2/2012	2012	2012-Q1	Jan 2012	2012-01	

Configure Month column with MonthSort as sort column

Columns for Month in Year and Day in week

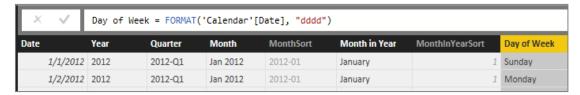

Creating the Month in Year column

Creating the MonthInYearSort column

Creating the Day of Week column

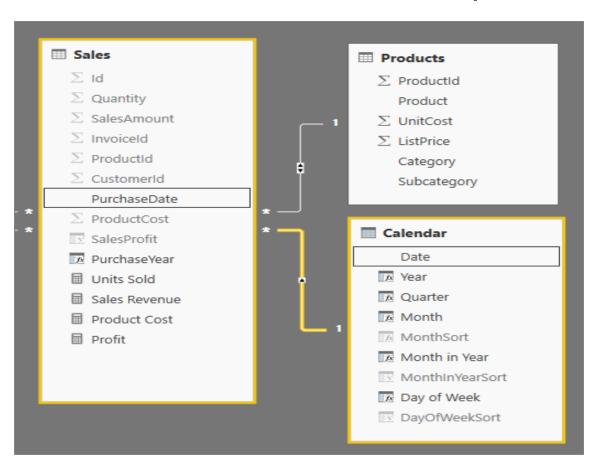

Creating the DayOfWeekSort column

Integrating Calendar Table into Data Model

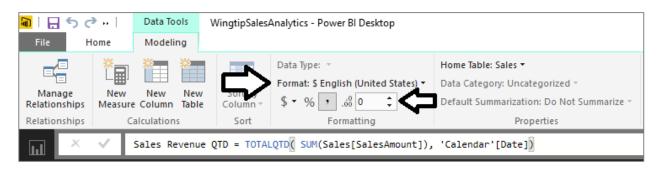

Calendar table needs relationship to one or more tables

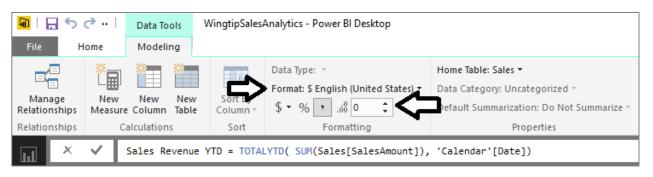

Calculated Fields for QTD and YTD Sales

TOTALQTD function calculates quarter-to-date totals

TOTALYTD function calculates year-to-date totals

Creating Running Total using CALCULATE

- Calculate a running total of sales revenue across years
 - This must be done using CALCULATE function

```
Data Type: "
                                                  Format: $ English (United States) *
  Manage
                New
                               New
                                        Sort By
              Measure Column Table
Relationships
                                       Column ▼
Relationships
                    Calculations
                                         Sort
                                                            Formatting
                     Sales Revenue RT =
1.1
                     CALCULATE(
                          SUM(Sales[SalesAmount]),
FILTER(
                              ALL('Calendar'),
唱
                              'Calendar'[Date] <= MAX('Calendar'[Date])
```

Sales Growth PM Measure - First Attempt

Create a measure named Sales Growth PM

```
Sales Growth PM =
DIVIDE(
    SUM(Sales[SalesAmount]) -
    CALCULATE(
    SUM(Sales[SalesAmount]),
    PREVIOUSMONTH(Calendar[Date])
),
    CALCULATE(
    SUM(Sales[SalesAmount]),
    PREVIOUSMONTH(Calendar[Date])
)
)
```

- Use measure in matrix evaluating month and quarter
 - Measure returns correct value when filtered by Month
 - Measure returns large, erroneous value when filtered by Quarter

				=	
Year	Quarter	Month	Sales Revenue	Sales Growth PM	
2014	2014-Q1	Jan 2014	\$629,969	-18.13 %	
		Feb 2014	\$609,637	-3.23 %	
		Mar 2014	\$628,618	3.11 %	4
		Total	\$1,868,225	142.79 %	$\langle \Box$
	2014-Q2	Apr 2014	\$661,588	5.24 %	4
		May 2014	\$748,193	13.09 %	
		Jun 2014	\$814,333	8.84 %	4
		Total	\$2,224,114	253.81 %	$\langle \Box$
	2014-Q3	Jul 2014	\$788,469	-3.18 %	7 -

Using the ISFILTERED Function

ISFILTERED function used to determine when perform evaluation

```
Sales Growth PM =
IF(
    ( ISFILTERED(Calendar[Month]) && NOT(ISFILTERED(Calendar[Date])) ),
    DIVIDE(
        SUM(Sales[SalesAmount]) -
        CALCULATE(
        SUM(Sales[SalesAmount]),
        PREVIOUSMONTH(Calendar[Date])
    ),
        CALCULATE(
        SUM(Sales[SalesAmount]),
        PREVIOUSMONTH(Calendar[Date])
    ),
        PREVIOUSMONTH(Calendar[Date])
    ),
    BLANK()
)
```

Expression returns Blank value when evaluation context is invalid

-				=	
Year	Quarter	Month	Sales Revenue	Sales Growth PM	
2014	2014-Q1	Jan 2014	\$629,969	-18.13 %	
		Feb 2014	\$609,637	-3.23 %	
		Mar 2014	\$628,618	3.11 %	4
		Total	\$1,868,225		< =
	2014-Q2	Apr 2014	\$661,588	5.24 %	7
		May 2014	\$748,193	13.09 %	
		Jun 2014	\$814,333	8.84 %	4
		Total	\$2,224,114	,	$\langle \neg$
	2014-Q3	Jul 2014	\$788,469	-3.18 %	7
		Aug 2014	\$869,143	10.23 %
